

CLAIMS

What is claimed is:

1. A system that facilitates search query results, comprising:
a client-side receiving component that accepts at least one query result from at least one search service; and
a client-side processing component that provides user-dependent query result information derived from the query result accepted by the client-side receiving component.
2. The system of claim 1, the user-dependent query result information comprising query result information derived from a user model.
3. The system of claim 2, the user model comprising a model that utilizes, at least in part, information related to at least one selected from the group consisting of a user context, a user profile, and a user query result rule.
4. The system of claim 1, the client-side processing component provides the user-dependent query result information *via* at least one visual indicator.
5. The system of claim 4, the visual indicator comprising at least one selected from the group consisting of highlighting, color, intensity of color, geometric shape, and quantity of geometric shapes.
6. The system of claim 1, the client-side processing component provides the user-dependent query result information *via* at least one aural indicator.
7. The system of claim 1, the client-side processing component derives the user-dependent query result information *via* evaluation of at least one link provided by the query result.

8. The system of claim 7, the evaluation of at least one link comprising a determination as to whether the link corresponds to at least one selected from the group consisting of a document with text and a document with links.

9. The system of claim 8, the client-side processing component provides an indication for the link of a percentage of at least one selected from the group consisting of text within the document and links within the document.

10. A method for facilitating search query results, comprising:
receiving at least one query result from at least one search service; and
providing user-dependent query result information derived from the query result;
the user-dependent query result information determined *via* client-side processing.

11. The method of claim 10, the user-dependent query result information comprising query result information based on a user model.

12. The method of claim 11, the user model comprising a model that utilizes, at least in part, information related to at least one selected from the group consisting of a user context, a user profile, and a user query result rule.

13. The method of claim 10, providing the user-dependent query result information further comprising:
relaying the user-dependent query result information *via* at least one search result page indicator.

14. The method of claim 13, relaying the user-dependent query result information comprising:
displaying, automatically, at least one thumbnail relating to a search query result page in response to a selection of a corresponding search query result link by at least one user; and

navigating to a portion of the search query result page and turning ON at least one search result page indicator in response to an interaction with the thumbnail by the user.

15. The method of claim 13, the search result page indicator comprising at least one selected from the group consisting of a visual indicator and an aural indicator.

16. The method of claim 15, the visual indicator comprising at least one selected from the group consisting of symbols, highlighting, color, intensity of color, geometric shape, and quantity of geometric shapes.

17. The method of claim 10, providing the user-dependent query result information further comprising:

deriving at least part of the user-dependent query result information *via* evaluating at least one link provided by the query result.

18. The method of claim 17, evaluating at least one link comprising:
determining whether the link corresponds to at least one selected from the group consisting of a document with text and a document with links.

19. The method of claim 18, further including:
providing an indicator for the link that indicates at least one selected from the group consisting of a text-content link and a link-content link.

20. A system that facilitates search query results:
means for accepting at least one query result from at least one search service; and
means for providing user-dependent query result information derived from the query result; the user-dependent query result information determined *via* client-side processing.

21. A user interface, comprising:
an interface adapted to communicate enhanced search query results to a user;

at least one input associated with the interface to provide information related to at least one search query result; and

at least one output to indicate user-dependent search query result information; the output utilizing, at least in part, a thumbnail view to convey the information.

22. The interface of claim 21, the input comprising user-model information utilized to provide enhanced search query results for the output.

23. The interface of claim 21, the input comprising at least one selection of at least one search query result.

24. The interface of claim 21, the output comprising an interactive output that responds to a user selection within the thumbnail view.

25. The interface of claim 21, the output comprising at least one indicator of whether a search query result link is at least one selected from the group consisting of a text-content link and a link-content link.

26. A data packet, transmitted between two or more computer components, that facilitates search query results, the data packet comprising, at least in part, information relating to a client-side search query system that utilizes, at least in part, user-related information to provide user-dependent query result data derived from a search service query result.

27. A computer readable medium having stored thereon computer executable components of the system of claim 1.

28. A device employing the method of claim 10 comprising at least one selected from the group consisting of a computer, a server, and a handheld electronic device.

29. A device employing the system of claim 1 comprising at least one selected from the group consisting of a computer, a server, and a handheld electronic device.
